BERRIES

OZONE20

NEVER TOO WET, NEVER TOO DRY

OZONE20 is the newest type of coco coir developed by Dutch Plantin to increase the air-% of coir without going too coarse.

Where standard good quality cocopith/cocopeat has an air-% of around 25% at -10 cm, we managed to increase this significantly. We worked over 25 years successfully with our 'fine dust removed' pith, and now we make a next step! With coco fibers, crush or chips you can easily increase the air-%, but berries don't like a too coarse growing medium. Berries need an optimum root contact.

We noticed that growers of strawberries in growbags would like to use the bags for more years, without getting a substrate what is holding too much water the later years. By reuse of coir old roots degenerate and parts are left in the substrate. Best qualities of stable coir decompose very slowly and contribute minimum of losing air.

Growers of raspberries and blackberries like to use the coir as well for several years, so the new OZONE20 suits perfectly. Of course we add this great new structure in our coarse blend for blueberries! These OpenTop Growbags we aim for 10 years use!

With the latest new techniques designed by Dutch Plantin we manufacture a coco coir product with an air-% of 40-45% at -10 cm and holding water to grow well! This gives enough space for the later years reusing the coir. This OZONE20 coir enables the grower to manage the growing perfectly with water-ratio between 45 and 80%.
