

WUXAL® Brassica

Suspension Fertiliser

Micronutrient fertiliser suspension with Boron, Manganese and Molybdenum.

Description

WUXAL Brassica is a micronutrient suspension for foliar fertilisation with Boron, Manganese and Molybdenum.

The composition of WUXAL Brassica, particularly its nutrient ratio, meets the specific micronutrient requirements of brassica, oilseed rape (canola) and sunflower.

Critical micronutrients such as B, Mn or Mo become unavailable in the soil particularly under the following conditions: cool and wet soil, unfavourable soil pH-value, heavy rains favouring leaching, poor root development and dry conditions. Foliar application of these micronutrients in autumn, where yield of following season is already determined, and during spring is known to increase yield and seed oil content.

Key benefits

- ▶ highly efficient and easy to handle
- ▶ optimal micronutrient ratio for oilseeds (oilseed rape, soybean, sunflower)
- ▶ micronutrients immediately available for leaf absorption
- ▶ accelerated oilseed rape development in autumn
- ▶ improved frost resistance
- ▶ improved pod set and reduced pod loss
- ▶ increased yield
- ▶ increased oil content in the seeds
- ▶ compatible with most commonly used pesticides

Contents

Micronutrient fertiliser suspension with boron, Manganese and Molybdenum.

For foliar fertilisation.

% w/w			g/l
6.0	B	Boron from Boric acid	84
5.0	Mn	Manganese	70
0.25	Mo	Molybdenum	3.5
3.0	S	Sulphur	42

Physical / chemical properties

Density: 1.4 g/cm³

pH value: 4.8

Colour: green
